Question 1

Displayed data below

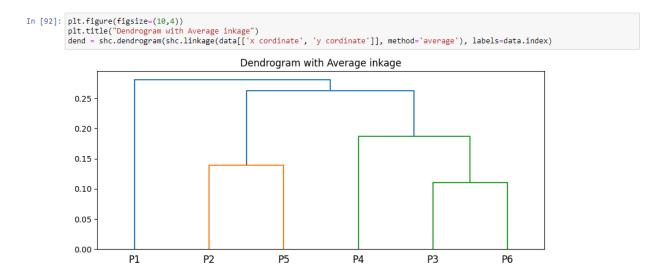

Question 1

```
In []: # Attached the Mathematical calculations in the submission Document. Below Code is just for the reference
 In [ ]: # calculate and find out clustering representations and dendrogram using Single,
         # complete, and average link proximity function in hierarchical clustering technique.
In [50]: import numpy as np
         import pandas as pd
         import matplotlib.pyplot as plt
         %matplotlib inline
         import scipy.cluster.hierarchy as shc
         from scipy.spatial.distance import squareform, pdist
         a = np.array([0.4005,0.2148,0.3457,0.2652,0.0789,0.4548])
         b = np.array([0.5306,0.3854,0.3156,0.1875,0.4139,0.3022])
         point = ['P1','P2','P3','P4','P5','P6']
data = pd.DataFrame({'Point':point, 'x cordinate':a, 'y cordinate':b})
         data = data.set_index('Point')
         data
Out[50]:
               x cordinate y cordinate
          Point
          P1 0.4005 0.5306
            P2
                  0.2148
                           0.3854
            P3 0.3457 0.3156
                            0.1875
         P5
                 0.0789 0.4139
            P6
                   0.4548
                             0.3022
```

Showing Dendrogram with Single linkage below using dendrogram method

Showing Dendrogram with Average linkage below using dendrogram method

Showing Dendrogram with Complete linkage below using dendrogram method

```
In [93]: plt.figure(figsize=(10,4))
plt.title("Dendrogram with Complete inkage")
dend = shc.dendrogram(shc.linkage(data[['x cordinate', 'y cordinate']], method='complete'), labels=data.index)

                                                                  int64
         dtypes: float64(14), int64(3), object(1)
         memory usage: 1.2+ MB
```

First, I have imported the required libraries. Then imported the dataset 'CC GENERAL.csv'. Dataset is also displayed using head () function and there is description of the dataset.

For Question 2(a), I have deleted the first column which is 'CUST_ID'. I have checked for the null

values in the dataset there are 2 attributes with the null values. I have used the mean values to fill the null values of those two attributes.

```
In [60]: df.isnull().any()

          TENURE
          dtype: bool
```

Use corr() function to find the correlation among the columns in the Dataframe using the 'Pearson' method. With green gradient.

For question 2(b), first I have applied the standard scaler. And then I have normalized the data using normalize () function. In above screenshot I have displayed the dataset after the standard scaler and after normalizing to see how dataset changes.

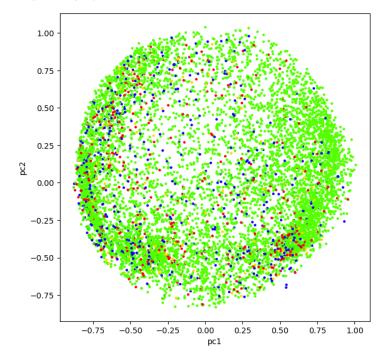

```
In [43]: x = df.iloc[:,0:-1]
         y = df.iloc[:,-1]
         scaler = preprocessing.StandardScaler()
         scaler.fit(x)
         X_scaled_array = scaler.transform(x)
         X_scaled_df = pd.DataFrame(X_scaled_array, columns = x.columns)
In [63]: #Normalization is the process of scaling individual samples to have unit norm.
         #This process can be useful if you plan to use a quadratic form such as the dot-product or any other kernel to quantify the simil X_{normalized} = preprocessing.normalize(X_{scaled_df})
          # Converting the numpy array into a pandas DataFrame
         X_normalized = pd.DataFrame(X_normalized)
         4
In [64]: pca2 = PCA(n_components=2)
         principalComponents = pca2.fit_transform(X_normalized)
         principalDf = pd.DataFrame(data = principalComponents, columns = ['P1', 'P2'])
          finalDf = pd.concat([principalDf, df[['TENURE']]], axis = 1)
         finalDf.head()
Out[64]:
                        P2 TENURE
                 P1
         0 -0.488186 -0.677233 12
         1 -0.517295 0.556075 12
         2 0.334385 0.287312 12
          3 -0.486617 -0.080780 12
          4 -0.562175 -0.474770 12
```

After applying normalizing we get array as an output so I have converted the array into panda dataframe and displayed the dataset named 'principalDf'.

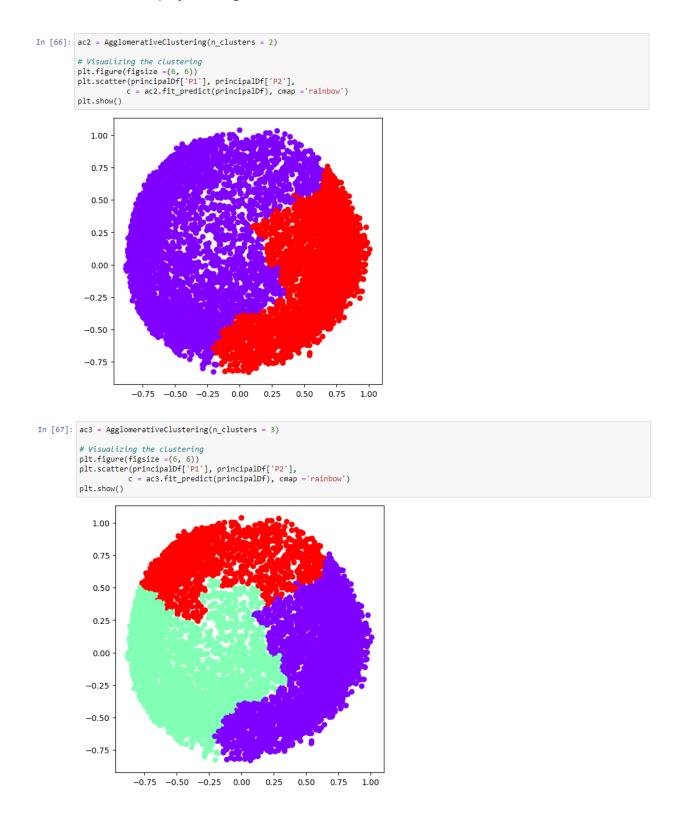

For Question 2(c), I have implemented PCA where I taken k = 2. So, the dataset x_norm has been transformed into array. I have again transform the array into panda dataframe which has 2 column named 'P1','P2' and the name of the dataset is x_pca. It is displayed in the screenshot.

```
In [65]: plt.figure(figsize=(7,7))
  plt.scatter(finalDf['P1'],finalDf['P2'],c=finalDf['TENURE'],cmap='prism', s =5)
  plt.xlabel('pc1')
  plt.ylabel('pc2')
```

Out[65]: Text(0, 0.5, 'pc2')

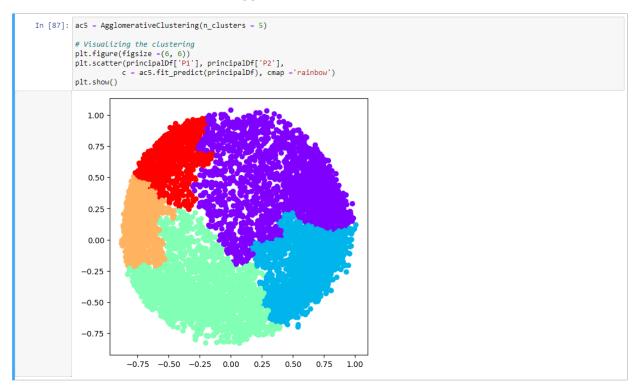

For question 2(d), I have implemented agglomerative clustering using sklearn library. Where the number of clusters is 2. Also, the output has been displayed using the scatterplot. 2 different cluster has been displayed using two different colors.

Above I have implemented the agglomerative cluster where number of clusters is 3. Three different colors represent three clusters.

```
In [68]: ac4 = AgglomerativeClustering(n_clusters = 4)
          # Visualizing the clustering
          plt.figure(figsize =(6, 6))
plt.scatter(principalDf['P1'], principalDf['P2'],
                      c = ac4.fit_predict(principalDf), cmap = 'rainbow')
          plt.show()
             1.00
             0.75
             0.50
             0.25
             0.00
            -0.25
            -0.50
            -0.75
                       -0.75 -0.50 -0.25
                                               0.00
                                                       0.25
                                                                0.50
```

Above is the implementation of the agglomerative cluster with number of the cluster 4.

Above is the implementation of agglomerative cluster where number of cluster is 5.

For question 2(e), first I have calculated the silhouette score for all clusters model named "\$2,\$3,\$4,\$5" and added to the list named "ss".

I have used the bar graph to represent the silhouette score of each model. In bar graph y-axis represent the silhouette score and x-axis represent cluster models.
